

Battery Filling Systems Introduces New Low Profile Series

January 2009

Battery Filling Systems has introduced the new low profile series watering system. The new clip-in low profile plug is 13 mm shorter than traditional plugs, drastically reducing the wear and tear on your watering system. Designed with encapsulated floats, snap-in float guards are now completely eliminated! The encapsulated plug protects the float, ensuring that the proper water levels are reached during each watering.

Battery Filling System's new Low Profile Plug is constructed of the highest quality materials that continue to keep all working parts above the battery cell. The Low Profile Plug works with high or low pressure, has a hydrometer port and a built-in water level indicator. The new clip-in design makes installation of systems easier. The system still maintains precise electrolyte levels and has a water trap to prevent dangerous hydrogen gas movement from cell to cell.

With over forty years experience designing water delivery technology, Battery Filling Systems offers a full five year warranty on every plug. Battery Filling Systems sets the standard for quality and performance with our new low profile series.

Battery Filling Systems is comprised of industry leaders in the engineering, manufacturing, and marketing of battery watering systems and water delivery items. The company is headquartered in Clemmons, North Carolina and was founded by current President, Scott Elliott. More information is available at www.batteryfillingsystems.com.
